

CENTRAL NERVOUS SYSTEM

PERIPHERAL NERVE

APPROVED

Christine Hulette MD

hulet001@mc.duke.edu

Objectives

- Recognize and describe the pathology of the common inflammatory/infectious, hereditary, nutritional/metabolic, toxic and traumatic peripheral neuropathies
- Describe the pathophysiology of the common forms of peripheral neuropathy

Symptoms associated with peripheral neuropathy are the same, regardless of the cause.

EM of cross section of peripheral nerve.

Myelin Sheath. Its thickness is a function of the axon diameter.

Axon

Schwann Cell

Pathological Terms Used

- Segmental Demyelination – Schwann cell injury
Demyelination and remyelination often occur together.
- Remyelination – repair of injury to Schwann cells
- Axonal Degeneration – injury to nerve cell body or axon results in muscle fiber atrophy.
- Nerve Regeneration and Reinnervation – recovery from injury to axon (sprouts).
Regeneration occurs as long as cell body is still viable.
- Myopathy – disease of muscle

Normal motor units

Segmental demyelination

Axonal degeneration

Reinnervation

Myopathy

Neurons

Myelin

Axon

Myocytes

one neuron innervates multiple muscle fibers. Creates a patchwork pattern.

Injury to Schwann cell. Creates short segments of thin myelin. Innervation is the same.

Death of one of the motor neurons. Axonal processes associated with the neuron die but there's still partial innervation. Cause muscle

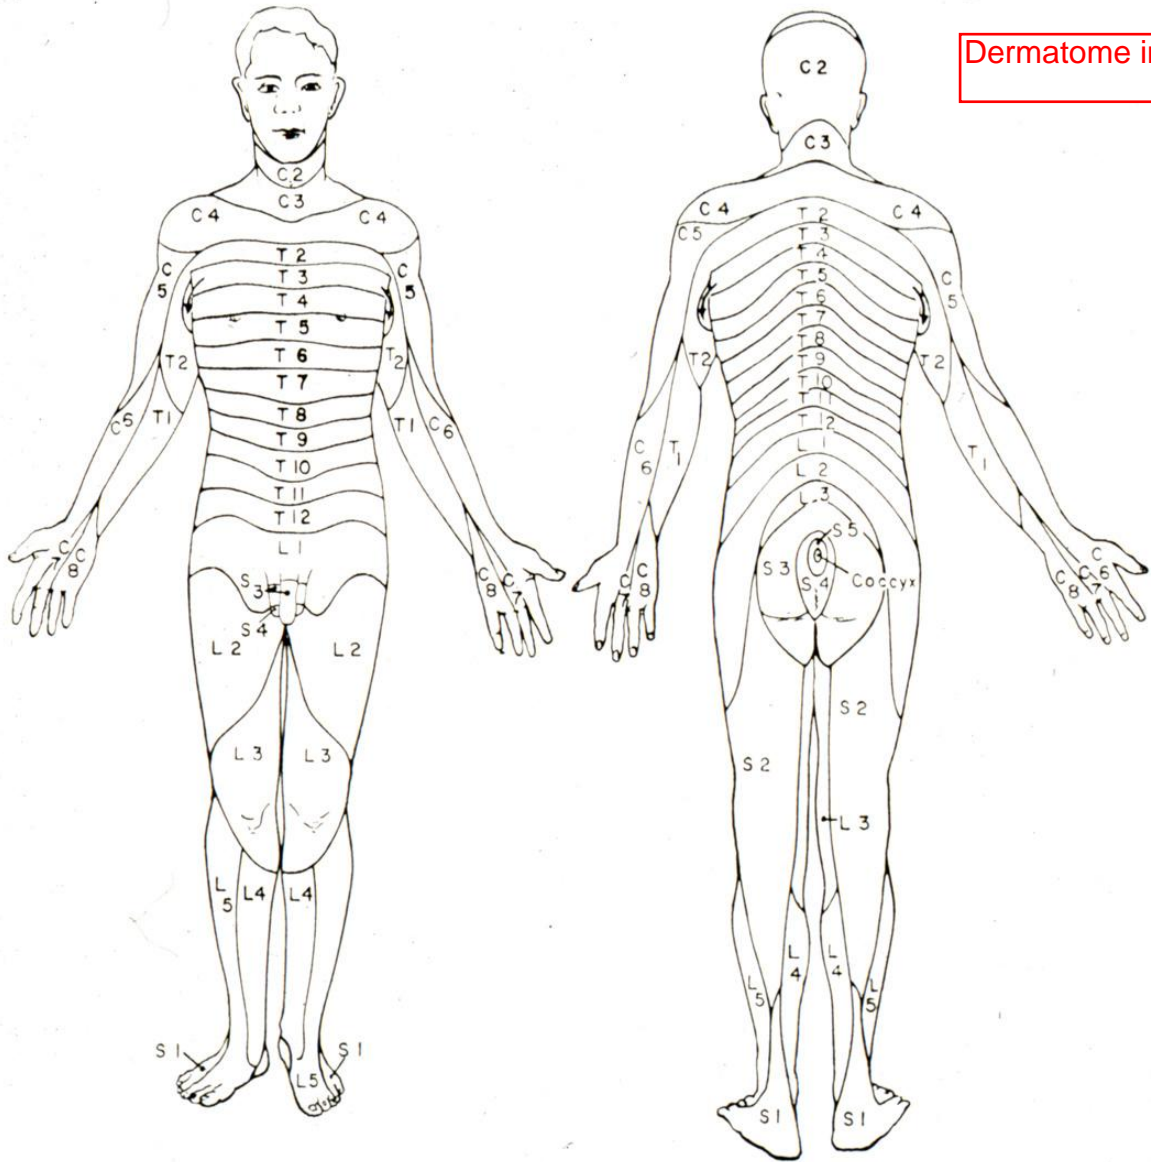

Severed axon. Innervation of muscle fiber interrupted. Axon sends out sprouts. Adjacent intact neuron takes over innervation but you no longer have patchwork pattern.

Nerve cells are fine but the damage occurs in the muscle.

Clinical Presentation

- Weakness
- Numbness
- Paresthesias Tingling sensations.
- Loss of sensation
- Symptoms correspond to dermatome

Dermatome innervations.

PERIPHERAL NEUROPATHY

- The causes of peripheral neuropathy are diverse.
 - Inflammatory/ Infectious
 - Hereditary
 - Nutritional and Metabolic
 - Toxic
 - Traumatic

PERIPHERAL NEUROPATHY

Inflammatory/ Infectious Causes

- Guillain-Barré syndrome, acute
- Chronic inflammatory demyelinating polyradiculoneuropathy (CIDP) Chronic form of Guillain Barre. Slower progression.
- Leprosy Not common in the U.S.
- Diphtheria Neurotoxin. Not common in U.S.
- Varicella-Zoster (Shingles) Common in the elderly.

Guillain-Barré

- Rapid, life threatening ascending paralysis
 - 1-3 cases per 100,000 persons per year in US
- Inflammation and demyelination of spinal and peripheral nerves.
- Preceded by an acute flu like illness.
- Idiosyncratic T cell mediated immune response to peripheral nerve myelin.
- Usually resolves with support of respiratory function.

Chronic inflammatory demyelinating polyradiculoneuropathy (CIDP)

Read slide

- Chronic, slowly progressive form of Guillain-Barre
- Inflammation with demyelination and remyelination of peripheral nerves.
- Idiosyncratic T cell mediated immune response to peripheral nerve myelin.

Infectious Polyneuropathy

- Lepromatous leprosy – Schwann cells invaded by *M. leprae*
- Tuberculoid leprosy – inflammation associated with *M. leprae* injures the nerves less severe form of leprosy
- Diphtheria - exotoxin injures the sensory ganglia
- Varicella-Zoster (shingles)- reactivated chicken pox virus leads to painful vesicles along the dermatome

Painful vesicles
along dermatome

Shingles

PERIPHERAL NEUROPATHY

Hereditary Causes

Compatible with normal life expectancy.

- Hereditary Motor and Sensory Neuropathies
 - HMSM I -Charcot-Marie-Tooth (hypertrophic neuropathy)– auto dom
 - HMSN II -autosomal recessive
 - HMSN III Dejerine-Sottas disease -auto rec
- Hereditary Sensory and Autonomic Neuropathies
- Neuropathy associated with inherited metabolic disease
 - Adrenoleucodystrophy
 - Refsum's disease
 - Porphyria
 - Familial amyloid polyneuropathy

HEREDITARY NEUROPATHY

Charcot-Marie-Tooth (HMSN I)

Onion bulbs

Thinly myelinated axon

Concentric ring of schwann cell proliferatoin

Causes peripheral nerve to feel knotty which can be palpated on physical exam.

Same thing as previous slide on EM

Myelin

Axon

Schwann Cells

PERIPHERAL NEUROPATHY

Nutritional and Metabolic Causes

- Diabetes
 - Most common cause
- Renal failure
- Thiamine (B₁) deficiency
 - Consequence of alcohol abuse
 - Chemotherapeutic agents Impairs DNA synthesis.
- Other vitamin deficiencies Less common
 - Cobalamin (B₁₂)
 - Pyridoxine (B₆)
 - α-tocopherol (E)
- Ethanol

Diabetic Neuropathy

- 50% of diabetics will develop peripheral neuropathy after 25 years of disease
- Distal symmetric sensory or sensorimotor neuropathy
 - Decreased sensation in the lower extremities
Often leads to foot ulcers
- Autonomic neuropathy
Bowel and bladder dysfunction

Diabetic Neuropathy

Thinly myelinated axon (demyelination)

Thickened, hyalinized arteriole.

Relatively normal axon

Sprouts (remyelination)

Sprouts (remyelination)

Segmental demyelination and remyelination!

PERIPHERAL NEUROPATHY

Toxic Causes

- Lead Still a problem in inner cities where lead based paint was used on houses.
- Arsenic
- Chemotherapeutic agents
 - Cisplatin
 - Vincristine
- Organic solvents
 - Glue sniffing
 - Industrial exposure

TOXIC NEUROPATHY

Wallerian degeneration of individual axons

Ovoid structures interrupt axoplasm. Represents degeneration. Schwann cells are fine, but the axons are damaged.

Normal axon

EM of same thing from previous slide

Axon with degenerating organelles in the cytoplasm.

PERIPHERAL NEUROPATHY

Traumatic

- Lacerations Common in gun shot wounds
Wallerian degeneration
- Avulsion Ex. Joint pulled out of socket which causes tearing of the nerve
Traumatic neuroma, proliferation of nerve twigs Very painful
- Compression neuropathy Fairly common
Carpal tunnel syndrome common in office workers
Morton neuroma Similar to carpal tunnel, but occurs in the feet

Traumatic neuroma

Proliferation of small nerves encased in perineurium

PathoPic image 7846

perineurium

nerve twig

nerve twig

nerve twig

Carpal tunnel syndrome

- Occupational hazard
- Office workers
- Can be treated with physical therapy and anti-inflammatory agents
- Severe cases progress to neurological deficits which must be corrected surgically

Surgery releases
connective tissue
from around wrist

The most common cause of numbing and paresthesias of the feet and hands (peripheral neuropathy) is

- A. Charcot Marie Tooth Disease
- B. Guillain-Barre syndrome
- C. Arsenic poisoning
- D. Shingles
- E. Diabetes**

PERIPHERAL NEUROPATHY

Neurogenic Atrophy of Muscle

(Type 2 fibers dark)

angulated atrophic fiber
